# OPTICAL CONNECTOR CONTAMINATION

## WHAT DO THE STANDARDS SAY?

The test procedures specified by 568-C require tools and procedures for **ensuring connector quality**.

- End faces on cords and trunks shall be in accordance to IEC 6100-3-35.
- Use a microscope that is compatible with IEC 61300-3-35.
- The microscope must use adapters that are compatible with connectors.

## WHAT IS IEC 61300-3-35?

- A set of requirements for Fiber Optic connector quality.
- Designed to guarantee insertion loss and return loss performance
- Used as reference between supplier and customer
- Used as condition for accurate testing of components and links.

## GENERAL ACCEPTANCE CRITERIA

Separate criteria for different connector types and performance.

- SM-UPC IL  $\leq 0.30\text{dB/RL} > 55\text{dB}$
- SM-APC IL  $\leq 0.35\text{dB/RL} > 65\text{dB}$
- MM-PC IL  $< 0.35\text{dB}$
- Multi Fiber SM IL  $< 0.50\text{dB/RL} > 60\text{dB}$
- Multi Fiber MM IL  $< 0.50\text{dB}$

■ Cable Installers ■ Network Installers

In a recent study, 98% of installers and 80% of network owners reported that issues with connector contamination was the greatest cause of network failure.

# OPTICAL CONNECTOR CONTAMINATION

## WHAT HAPPENS IF THE OPTICAL CONNECTOR ENDFACE BECOMES CONTAMINATED?

Examples of common contaminants adhering to end face:

Hand Lotion

Fiber Residue

Dirt and Dust

Troubles caused by connector end face contamination:

Light is transmitted poorly or not at all.

Light is reflected back to connection point\*

\*returning to the transmission point, causing equipment breakdown or bit errors.

### Optical connector must have no contamination prior to mating

What can happen when the optical end face is dirty? The beam of light may not be able to travel through the core. Optical connectors become contaminated from a variety of reasons. Usually 2 - 15 micron sized contaminants will have an impact on the signal transmission and could cause damage to the optical end face. The majority of network down time is caused by optical connector contamination.

Light beam is prevented from passing through due to contaminants on the end face, resulting in light reflection.

## WHAT CAN HAPPEN WHEN CONTAMINANTS ADHERE TO THE CORE?

Contaminants at the side of the ferrule prevent light from properly passing through due to poor alignment.

### Mating a clean connector to a dirty connector

When the unclean optical connector is mated, the contaminant is forced into the ferrule and may become permanently damaged. In this situation, the damage cannot be removed with an optical cleaner.

When contaminants adhere to the core, they will cause increase in signal interruption and increase amount of insertion loss and degradation of return loss. Also, these kinds of contaminants can cause chips, pits, and scratches in the connector end face under the pressure of the physical connection. Large contaminants can result in gaps in the physical connection, resulting in increased loss. These kinds of contaminants can actually spread and migrate by the physical connection.
